

Beginning Dimensional Modeling

Joe Cline

SENIOR DATA ENGINEER & MODELER

@d8ajoe www.linkedin.com/in/josephcline

In This Module

Why have a separate model for business intelligence and analytics?

Basic terminology and concepts

Key performance indicators (KPIs)

Demonstration

- Create a dimensional model

Video 2 starts here (placeholder)

The Current Relational Data Model

Hotel data

Guest data

The guest's stay data

Future Requirements

Perform EDA (Exploratory Data Analysis)

Hotel performance reports

Rates and inventory optimization

Write Intensive Operations

Inserting new guest rows

Updating existing guest rows

Taking rooms in and out of inventory

Making rate changes across dates

Highly Write Intensive

Online Transactional Processing

Also known as OLTP, is a type of database design for applications with a higher write transaction to read transaction ratio

Read Intensive

Analytics and reporting are read intensive

Data gets pulled into memory

Aggregate operations performed

Slows down OLTP databases

Waiting sucks!

(This is me getting settled in)

zzz

Decision Support System

Also known as DSS, is a computational system configured and designed for analytical processes to support the business decision make process

Examples of Decision Support Systems

Data Warehouse

Top-down; traditional;
been around since 80s

OLAP Cubes

Bottom-up; purpose
specific; a logical data
warehouse

Data Lake

A result of big data
and Hadoop; raw data;
ad-hoc analysis

It's the data, stupid.
(Just kidding, you are so smart)

Dimensional Data Model

A data model designed with fact and dimension tables used for analytical processing in decision support systems

Video 3 starts here (Placeholder only)

Terminology and Concepts

Facts, measures, and fact tables

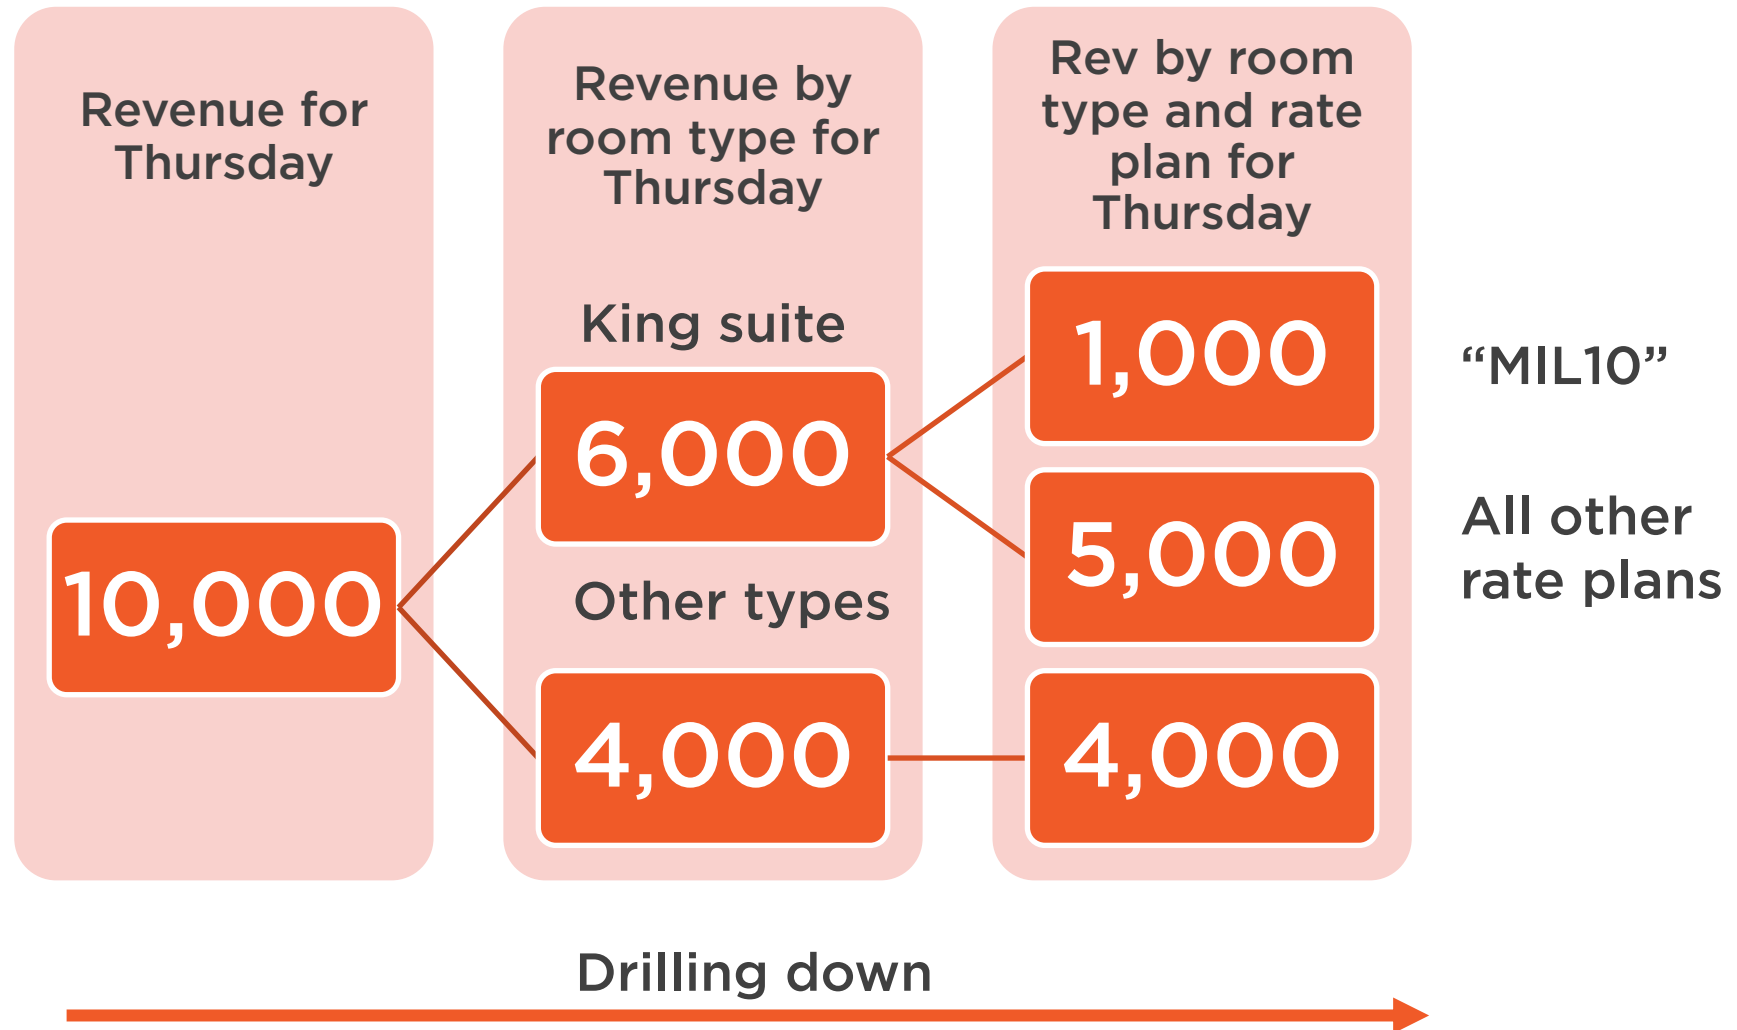

Dimensions, dimension tables, and the special Time dimension

Star and snowflake schema

Metrics and KPIs

Slicing, granularity and drilling down

An Example of Granularity

Video 4 starts here (Placeholder only)

Terminology and Concepts

OLAP cubes

Slowly changing dimensions

Dimensional hierarchy

More on drilling down

Online Analytical Processing

Also known as OLAP, is a type of database design for applications with a higher read transaction to write transaction ratio; used in a DSS

Slowly Changing Dimension: Type 0

First name	Last name	Birthdate	Address	City...
Jim	Doe	1/1/1970	123 E. Street	Anytown

Slowly Changing Dimension: Type I

Timestamp	First name	Last name	Birthdate	Address	City
2-17-2010 01:01:00	Jim	Doe	1-1-1970	123 E. Street	Anytown

Slowly Changing Dimension: Type I

Timestamp	First name	Last name	Birthdate	Address	City
6-23-2014 01:04:00	Jim	Doe	1-1-1970	456 W. Blvd	Otherville

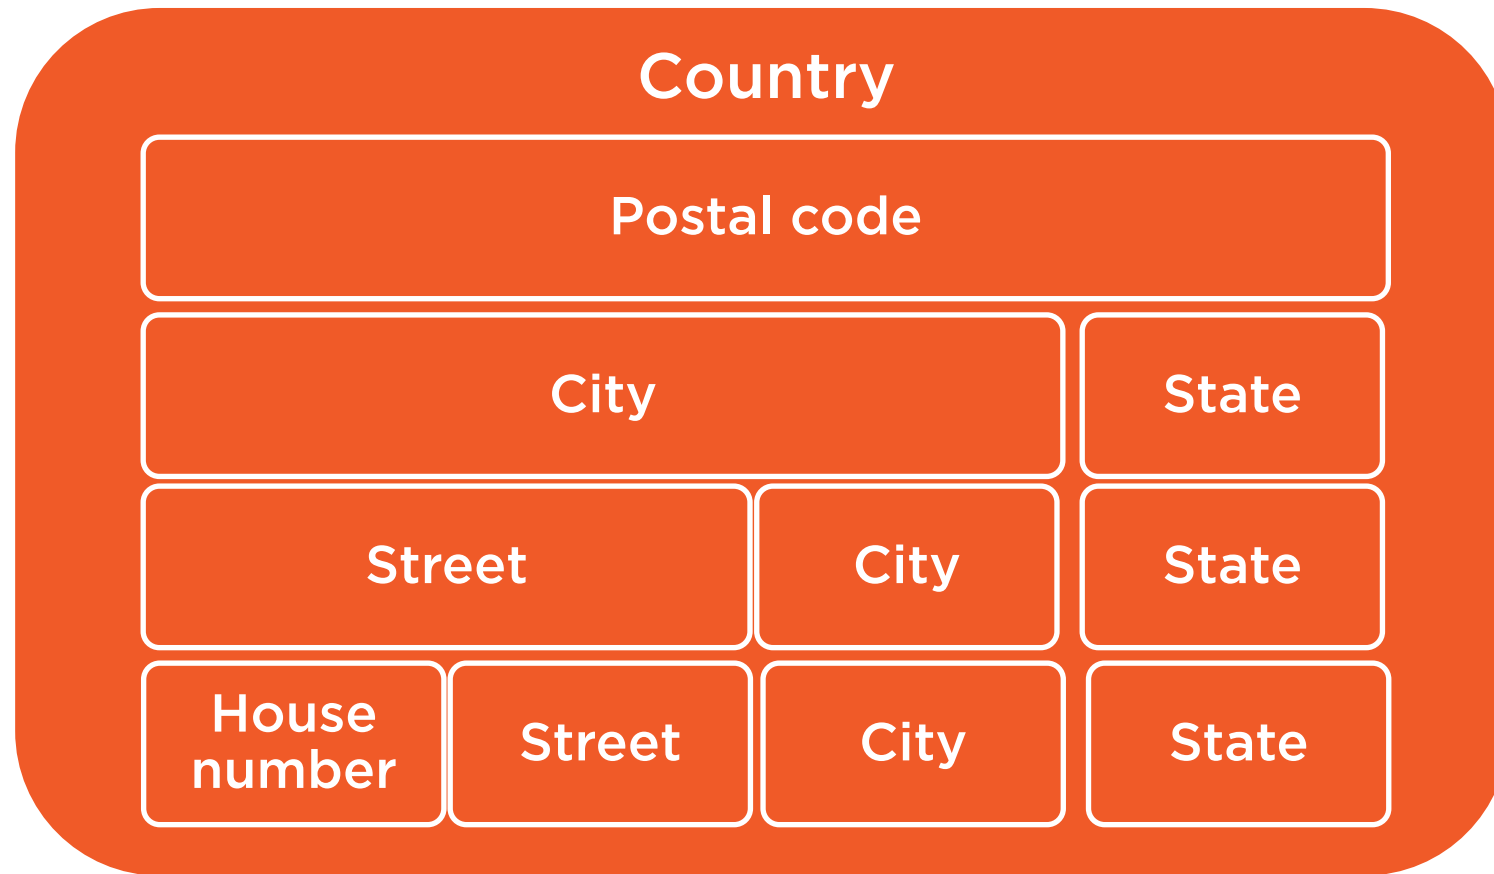

Slowly Changing Dimension: Type II

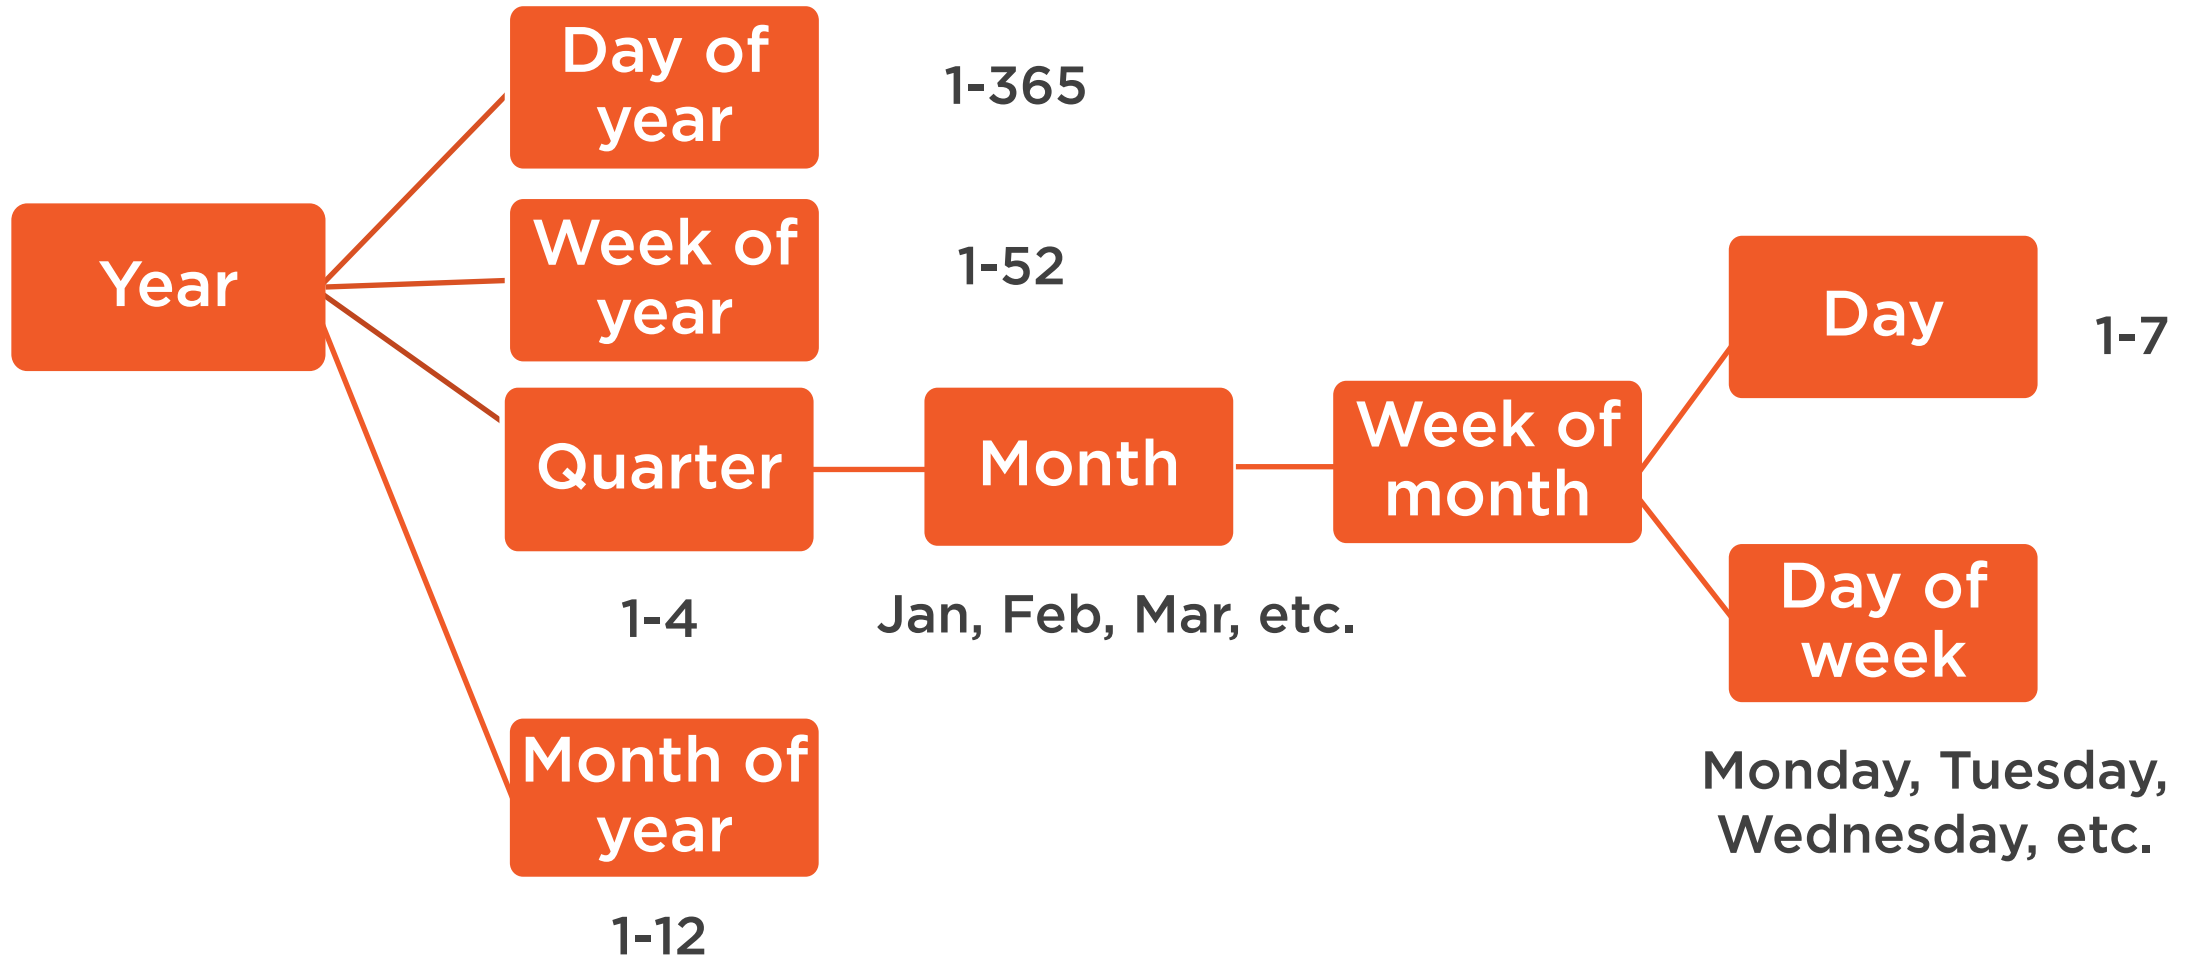

Timestamp	First name	Last name	Birthdate	Address	City
2-17-2010 01:01:00	Jim	Doe	1-1-1970	123 E. Street	Anytown
6-23-2014 01:04:00	Jim	Doe	1-1-1970	456 W. Blvd	Otherville

Dimensional Hierarchy

Time Dimension

Video 5 starts here (placeholder only)

Hotel Industry Key Performance Indicators

Occupancy percentage

ADR - average daily rate

RevPAR - revenue per available room

Hotel Industry KPI Formulas

Occupancy percentage

- *Occupancy % = rooms occupied / rooms available*

ADR

- *ADR = total room revenue / total rooms occupied*

RevPar

- *REVPAR = total room revenue / total rooms available*

Demo

Time to create a dimensional data model

Summary

Why we have a separate data model for analytic processing

Terms and concepts of dimensional modeling

KPIs considered in a dimensional model

Demo to create a dimensional model
